

Define and redefine **struct Neuron** separately

Define a
data
structure

1

```
#include <stdio.h>

struct Neuron {
    int neuronNum;
    double input1, input2;
    char areaName[20];
};
```

Refine
struct Neuron to
Neuron

2

```
typedef struct Neuron Neuron;

int main(void) {
    Neuron neuron;
    neuron.input1 = 7.9;
    return 0;
}
```

Define and redefine **struct Neuron** in the same statement

Refine
struct Neuron to
Neuron

2

```
#include <stdio.h>

typedef struct Neuron {
    int neuronNum;
    double input1, input2;
    char areaName[20];
} Neuron;
```

1

Define a
data
structure

```
int main(void) {
    Neuron neuron;
    neuron.input1 = 7.9;
    return 0;
}
```
